PLASMA-OVALBUTTON

Plasma Vaporization – the Next Generation

Plasma vaporization provides a safe, easy-to-use solution for TUR tissue-management procedural needs with only a fraction of the costs of laser treatments. The Olympus Plasma system provides an optimized interaction between the Plasma vaporization electrodes and the high-frequency (HF) generator so that instant plasma ignition and stable plasma vaporization are guaranteed for the smooth vaporization of prostatic tissue.

Plasma-OvalButton – the Revolution in Plasma Vaporization

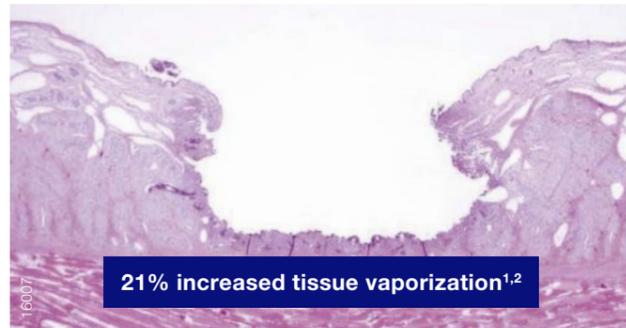

With the latest Olympus innovation, the **Plasma-OvalButton**, the procedure of Plasma vaporization is brought to a new level in efficiency, versatility, and safety. Its oval shape, combined with an easy-to-learn vaporization technique, results in well-coagulated, smooth tissue.

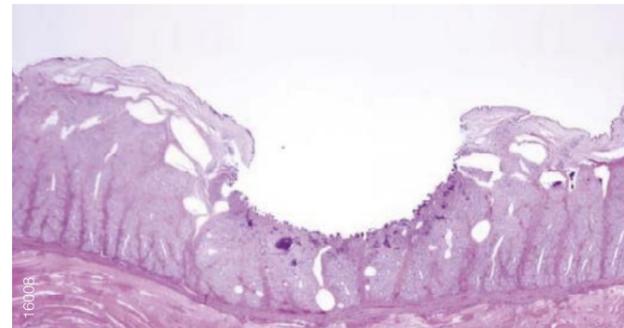

Efficiency

- Designed for enhanced TUR procedural efficiency with 25% increased width and 31% increased cross-sectional area^{1,2,13}
- Enhanced stability with new ceramic disk¹³
- 21% increased tissue vaporization^{1,2,13}

PLASMA VAPORIZATION THERAPY

Clinical Advantages of the Plasma Vaporization Technique

Safety

- Reduced risk of TUR syndrome compared to M-TURP³
- 64% less obturator nerve stimulation compared to M-TURB⁸
- 27% fewer severe complications compared to TURP⁶
- 82% lower blood transfusion rate compared to M-TURP¹⁰
- 83% fewer readmissions compared to TURP¹⁰

Time-Efficient

- Significantly shorter hospital stay compared to TURP⁵
- Shorter catheterization time compared to TURP⁶
- Potential for day surgery due to a shorter catheterization period and hospital stay

Risk Patients

- Use has been demonstrated in patients on anticoagulants⁴

Cost-Efficient

- A fraction of the material cost of photoselective vaporization (PVP)
- Costs 21% lower compared to M-TURP^{7,12}

Easy Handling

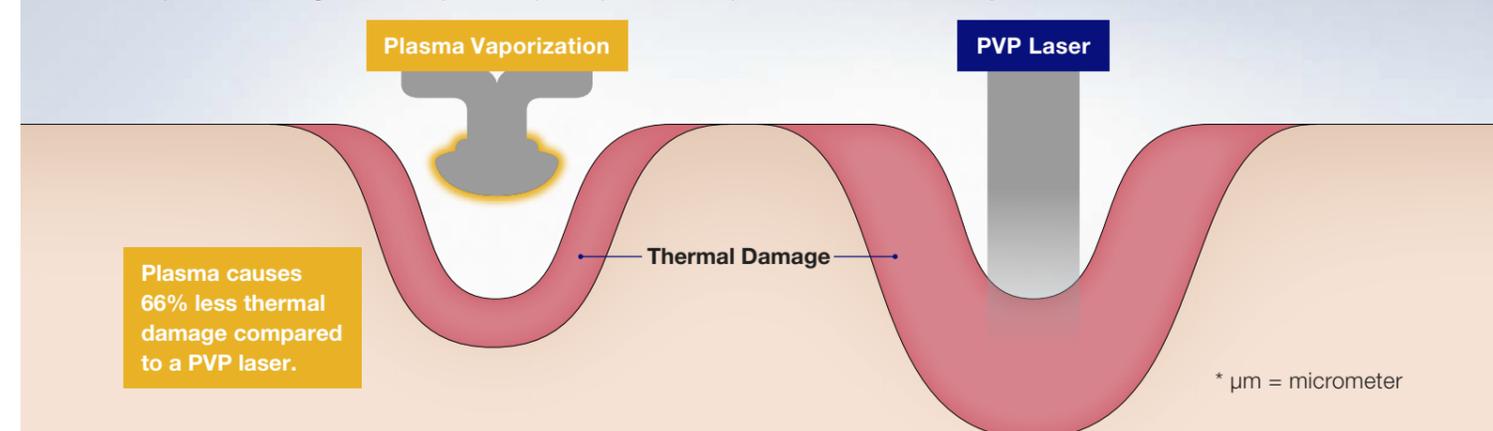

- Short learning curve – just as simple as standard resection¹¹
- Continuous plasma activation and instant ignition
- Clear and unobstructed view throughout the operation as neither tissue nor laser impulses impair vision

Plasma – Controlled and Stable Energy with Minimal Thermal Damage

While most energy-based surgical products, such as lasers and monopolar electrosurgical devices, use heat-driven processes to remove or cut tissue, the Plasma vaporization technology creates a controlled, stable plasma field to remove tissue at a **low relative temperature**, resulting in **minimal thermal damage** to surrounding soft tissues and a **low penetration depth of energy**.

Heat-Damage Zone of Plasma Vaporization vs. PVP Laser 180 W (192 vs. 562 μm*)⁹

Deeper heat-damage zones may lead to post-operative complications like increased dysuria rates.

PLASMA VAPORIZATION

What Is Plasma?

Plasma is one of the four fundamental states of matter and is created by applying energy to a gas. Molecules are ionized, thus turning the gas into plasma. Due to its conductivity, the plasma allows the energy to cross at lower energy levels. This effect leads to low operating temperatures and, therefore, less thermal spread. Tissue is vaporized in a locally confined denaturation process, while surrounding tissue heating effects are minor. It appears yellow due to the sodium that is dissolved in the saline – not due to heat or burning features.

Study Abstracts of Plasma Vaporization

“The final postoperative aspect revealed a large prostatic fossa and a particularly smooth surface and sharp margins of the vaporization area, without irregularities or obstruction.”⁸

“We determined reduced capsular perforation and intraoperative bleeding rates for this technique.”⁸

“Plasma vaporization occurs by direct gentle contact with the tissue surface and performs concomitant hemostasis.”⁵

Ordering Information

Plasma Vaporization Electrodes

Order Nr. Description

WA22566S Plasma-OvalButton

WA22541S Plasma-OvalButton-Long

WA22557C PlasmaButton

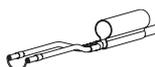

Further Plasma Electrodes

Order Nr. Description

WA22301D PlasmaLoop, 12°, small

WA22305D PlasmaLoop, 30°, small

WA22302D PlasmaLoop, 12°, medium

WA22306D PlasmaLoop, 30°, medium

WA22503D PlasmaLoop, 12°, large

WA22507D PlasmaLoop, 30°, large

WA22332D PlasmaLoop - Angled, 12°, 30°, and 45°

WA22351C PlasmaRoller, 12° and 30°

WA22355C PlasmaNeedle - Angled, 12°, 30°, and 45°

WA22540S PlasmaNeedle - Right-Angled, 12° and 30°

WA22558C Plasma-TUEBLoop for transurethral enucleation
